Q: how to set a custom font for a WPF app I know that I could make it in xaml with `TextElement.FontFamily="{StaticResource Brown}"` But I would like to avoid it and have a button that has a custom font that will be used by all buttons on the app. Can I do that? A: Yes, you can use `ResourceDictionary` for that: Segoe UI Don't forget to copy the font files to the directory that contains your application resources. To make it convenient I use a resolver for the `ResourceDictionary` like this: `public class ResourceDictionaryResolver : IResourceDictionaryResolver { public ResourceDictionary Resolve(string resourceKey) { var path = _resolverService.GetResourcePath(resourceKey); 82157476af`
